

S.2 HOLIDAY WORK

WATER

In many rural areas in Uganda, village populations have outgrown their initial water sources and fetching and purifying water becomes a burdensome task that takes up many precious hours every day. Women and children walk miles to find water for their families. Often, they draw polluted water from a stream or pond that they share with cattle and wild animals.

This a common practice in one of the villages known as Mukunge and the people in that village have requested their chairperson to find alternative water sources which are clean and not shared with animals.

Task

Prepare a poster for the chairperson. The poster should include sources of water, the ones which are not shared directly with animals and how to purify polluted water for consumption.

NOTE: ATTEMP ONE OF THE TWO PROJECTS

RPROJECT 1: MODELLING A WATER CYCLE

- By the end of this activity, you should be able to model a water cycle and advise the community on the importance of wetland conservation.

What you need.

- Rubber band
- Container
- Water
- Clear plastic bowl
- Film wrap

What to do

- Place a container having some soil into the bowl and add some water into the bowl. Leave the top part of the container open.
- Cover the top part of the bowl with a film wrap with the aid of a rubber band.
- Put the set up into sunlight and leave it to stand for about 8 hours

Discussion questions.

- Did droplets appear on the inside or outside of the jar?
- Where do you think the droplets came from?
- What role did sunlight play in the project?

PROJECT 2: HOMEMADE CHARCOAL WATER PURIFIER

- By the end of this activity, you should be able to make a homemade water purifier to see how suspended matter can be filtered from water.

What you need.

- 1.5L mineral water bottle
- Fine sand and large grained sand
- Charcoal granule
- Straw
- Gravel
- Cotton wool

- Coffee husks

What to do

- Cut off the bottom of the 1.5L mineral water bottle.
- Make a hole in the lid and fit in a straw through which filtered water will pass
- Insert cotton wool at the bottom of the bottle and lay fine sand on top. The next layer is charcoal granules followed by coarse sand and finally gravel
- After the layers have been laid, pour contaminated water from the top and put a clean container at the bottom to collect clean filtered

water.

Discussion questions.

- a) What is the role of the charcoal granule in the purifier.

.....

- b) Research and find out how the coffee husks can be fitted into the purifier. What would be the reason for their inclusion.

.....

- c) Discuss how the purifier can be improved and how can you ensure that it remains functional.

.....

.....
